

How to Understand FOSS

a visual guide to

Free & Open Source Software

Rev 18 2009-03-27

by Martin Owens

FOSS

Is a Creative Commons...

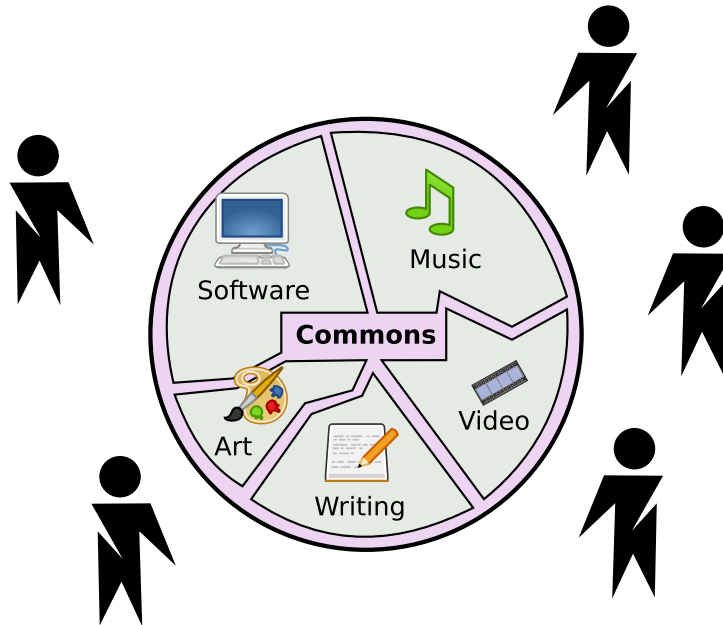

The Commons

**Resources that are accessible to everyone,
Regardless of country or ability to pay.**

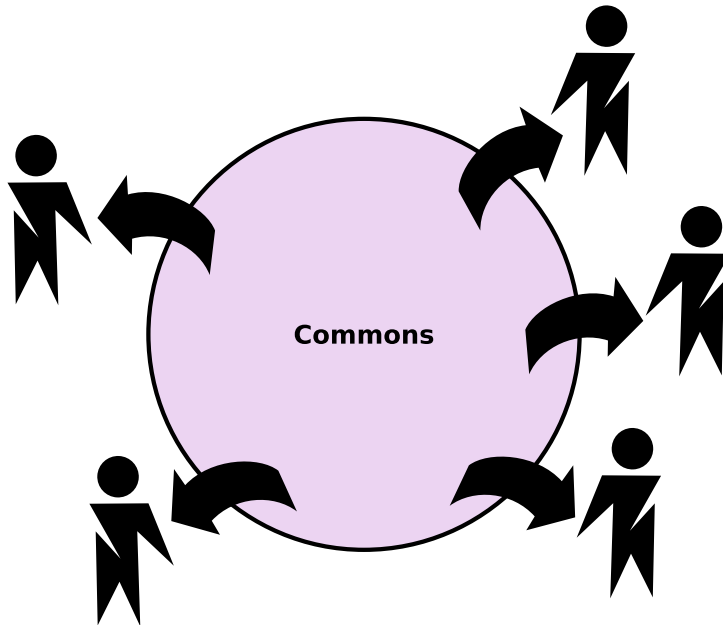

The Commons

These resources can be anything.
The Creative Commons is for all types of creative works.

The Commons

Everyone can make copies of anything
in the Creative Commons.

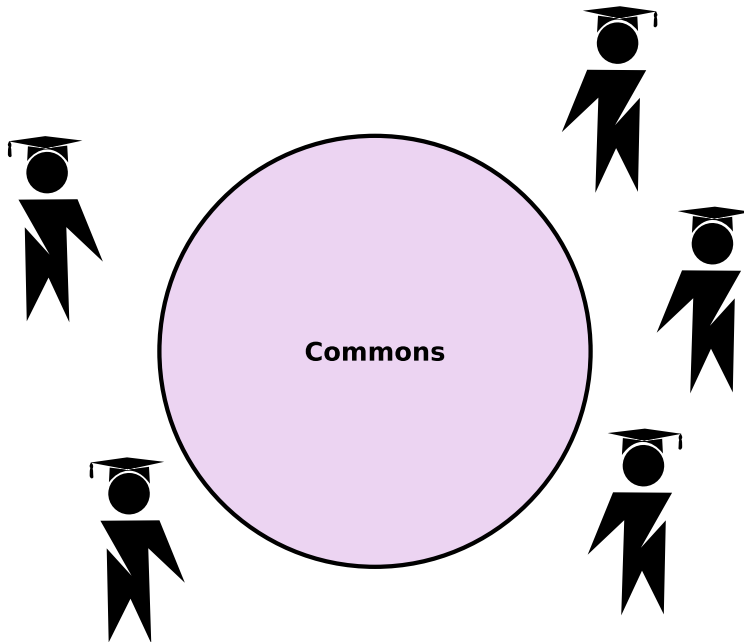

The Commons

Everyone can add anything
to the Creative Commons.

The Commons

Everyone can learn from
the Creative Commons.

The Commons

Anyone can share the Creative Content
with anybody else.

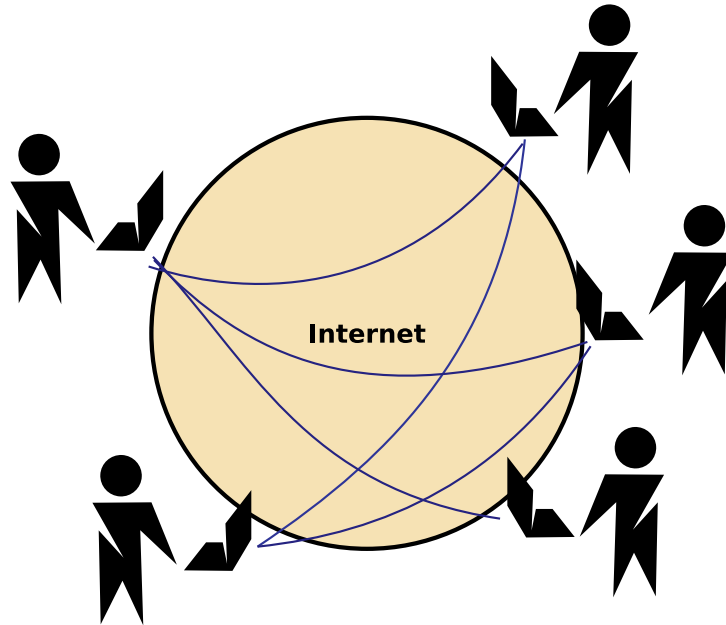

The Commons

Because the source is available, anyone can build on other works to create new "derivative" works.

The Internet

The Internet allows this free exchange of ideas and creative works across the whole world.

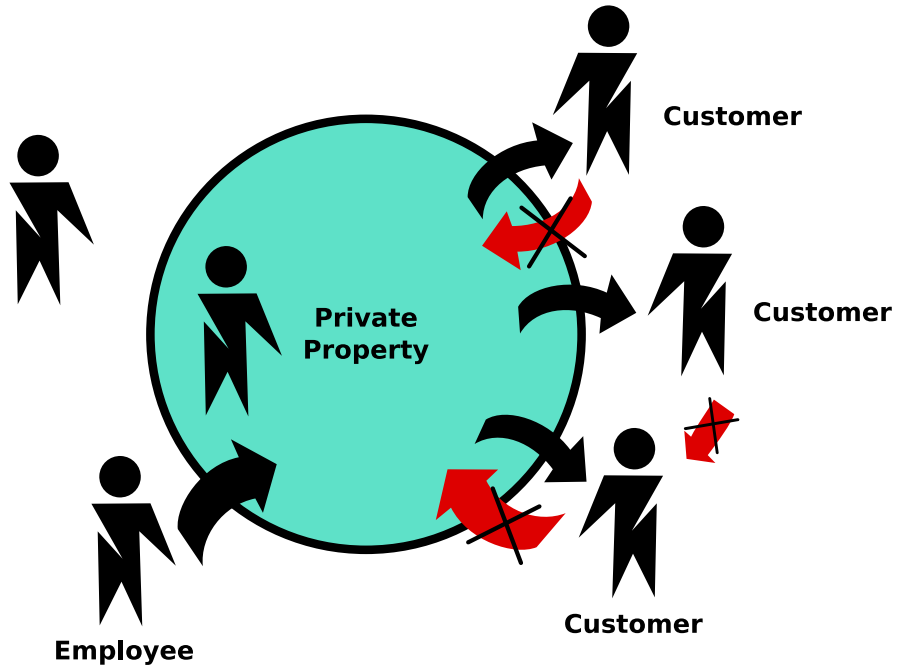

Closed Source

**Closed source is the same as Non-Free
it is the creation of content as a private property freely
accessible only to the owner (company or person).**

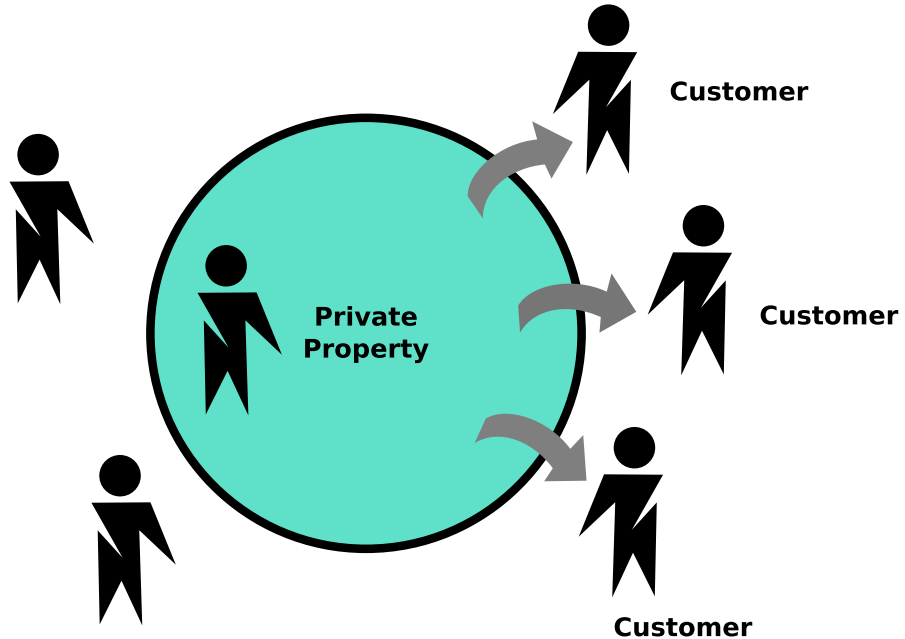

Closed Source

The Private Property model does not allow any sharing, building upon or learning to happen.

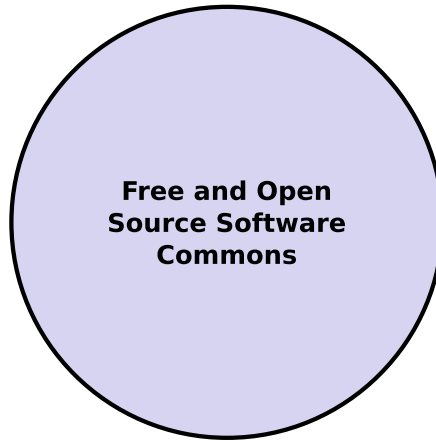

Closed Source

The user has only one right, the right to use.
And the only choice is to buy again or find an alternative.

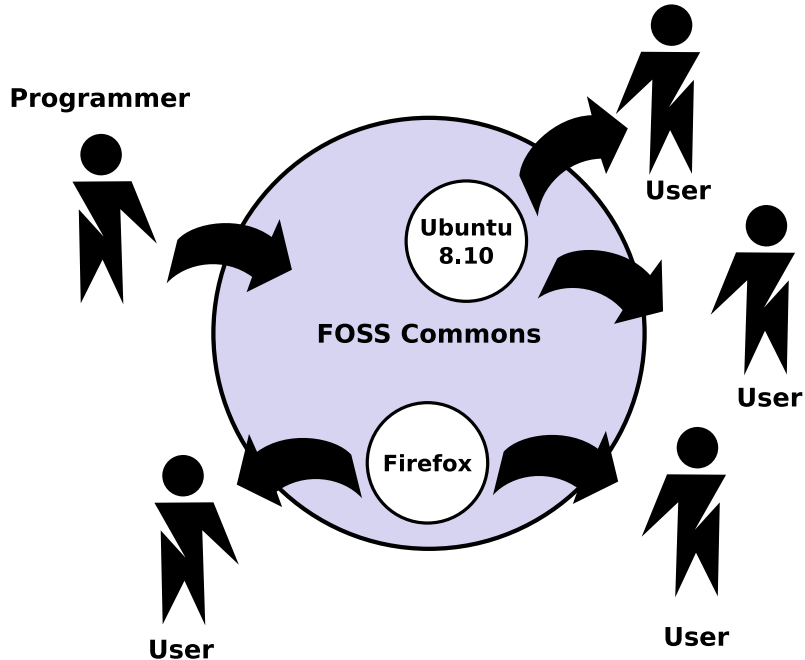

FOSS

That is why FOSS is a Commons system, not a Private Property system. This has some implications....

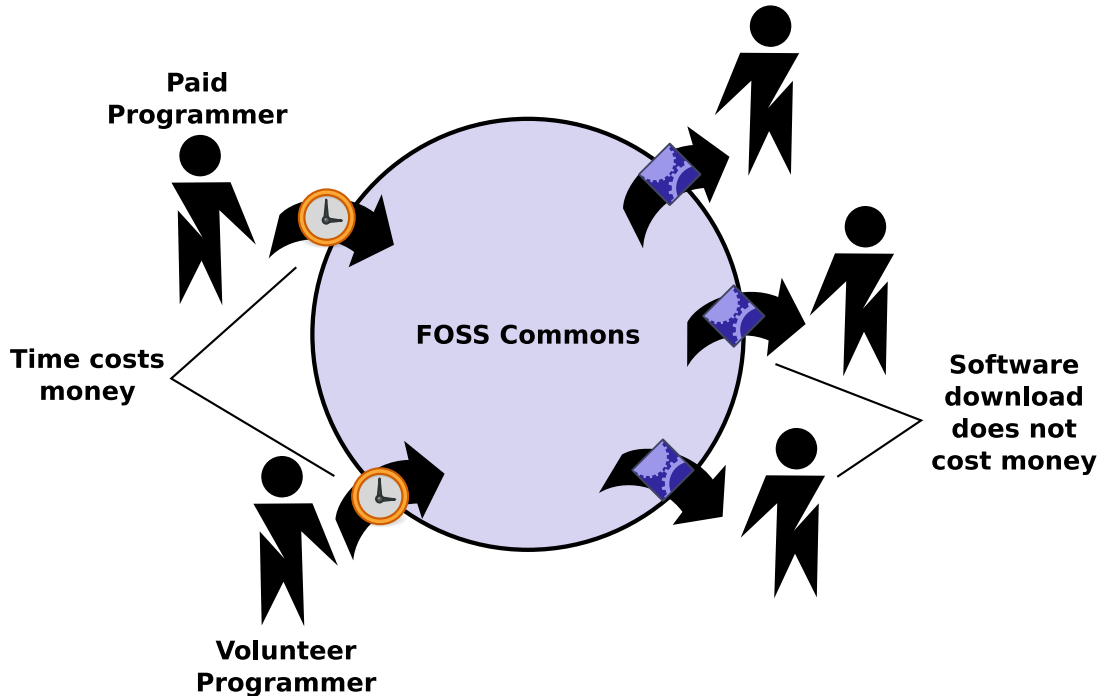

Once Created

Once software has been created and placed into the Commons
It can be used by anyone, for any reason, at any time.
The number of copies is never limited.

Creation Costs

But software creation, new features and bug fixes do cost resources (money, time, etc).

Creation Costs

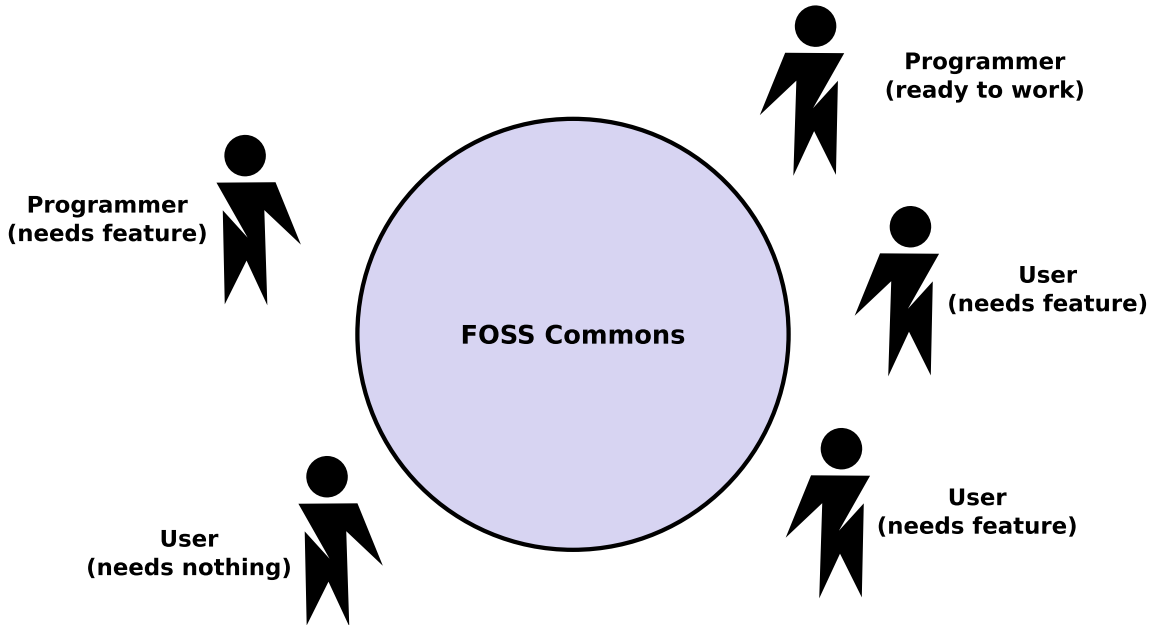

Compared to the costs of closed source.

Paying the Costs

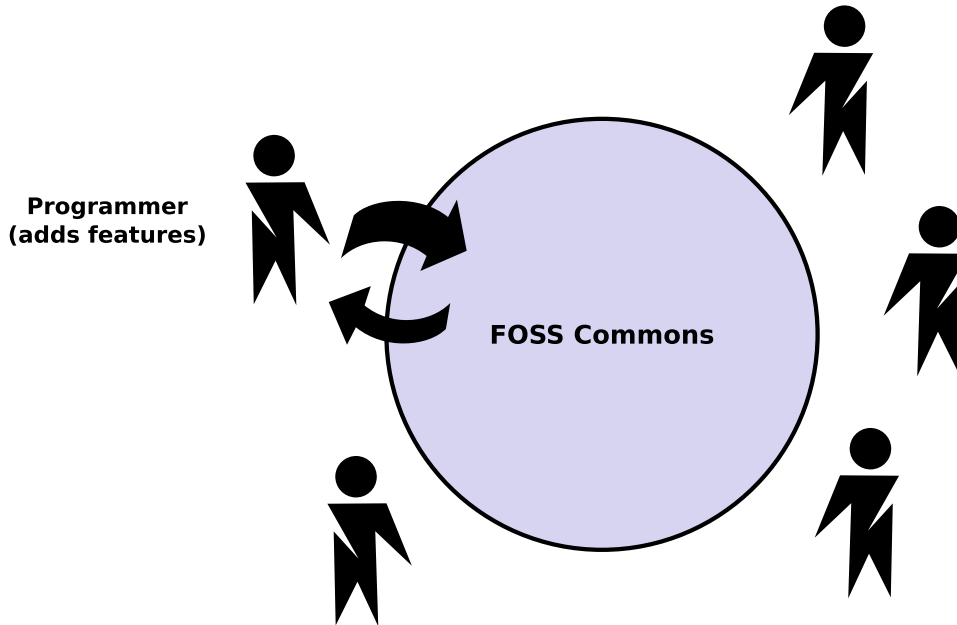

Supporting development costs requires resources.

Example:

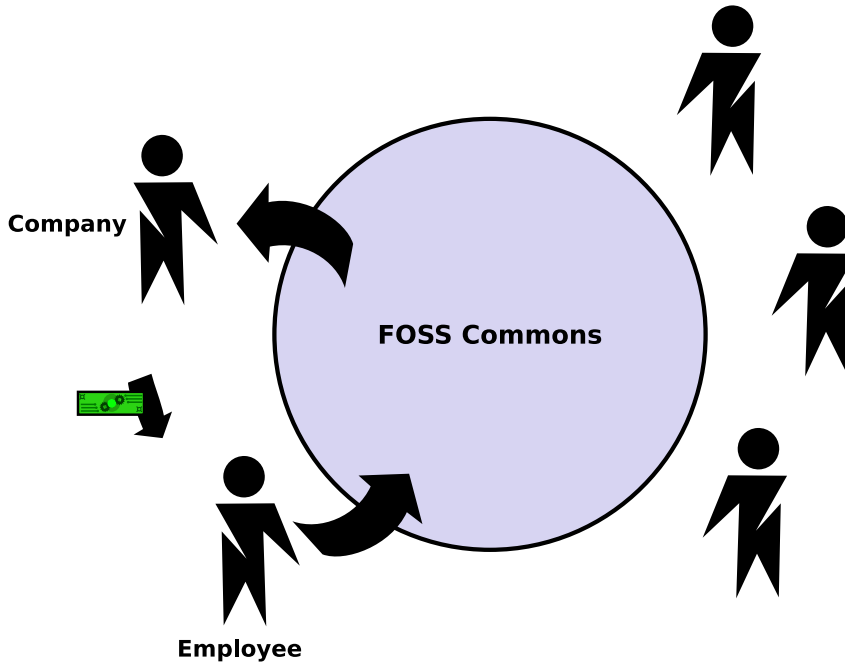

Enlightened Self Interest

A skilled programmer with access to the source code can serve her own needs, giving back to the community in the process.

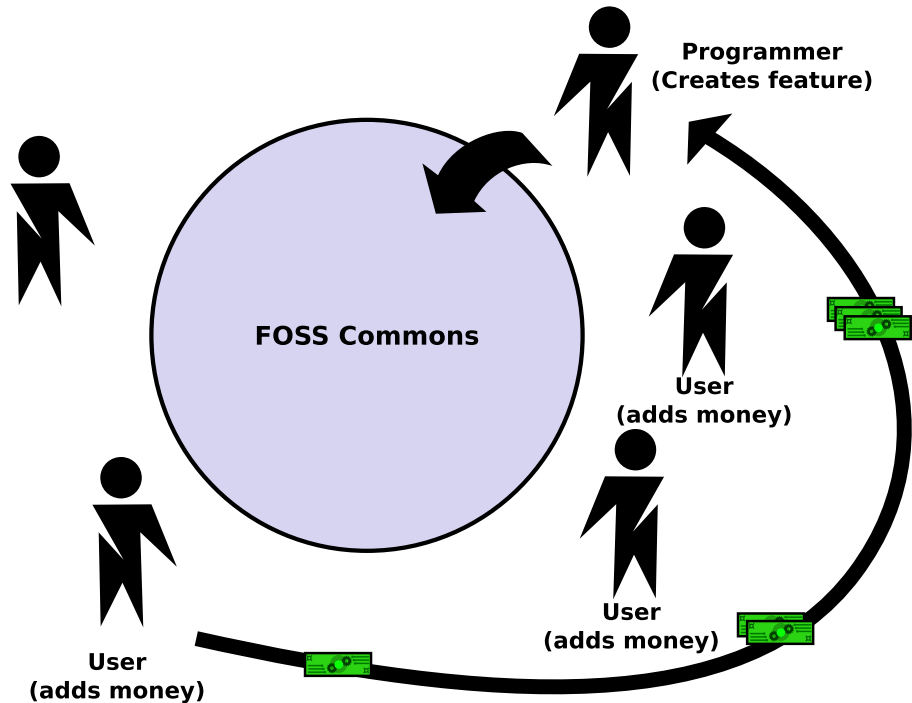

Employed

An organisation can use an employee to serve their software development needs in the commons.

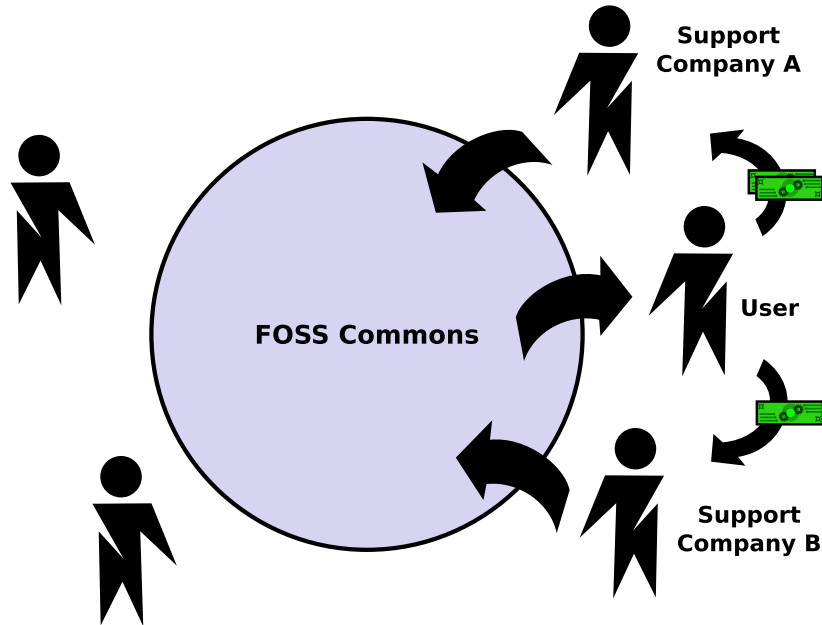

Aggregated Funding

If the programmer can aggregate money from multiple users, she can get paid for creating software they need.

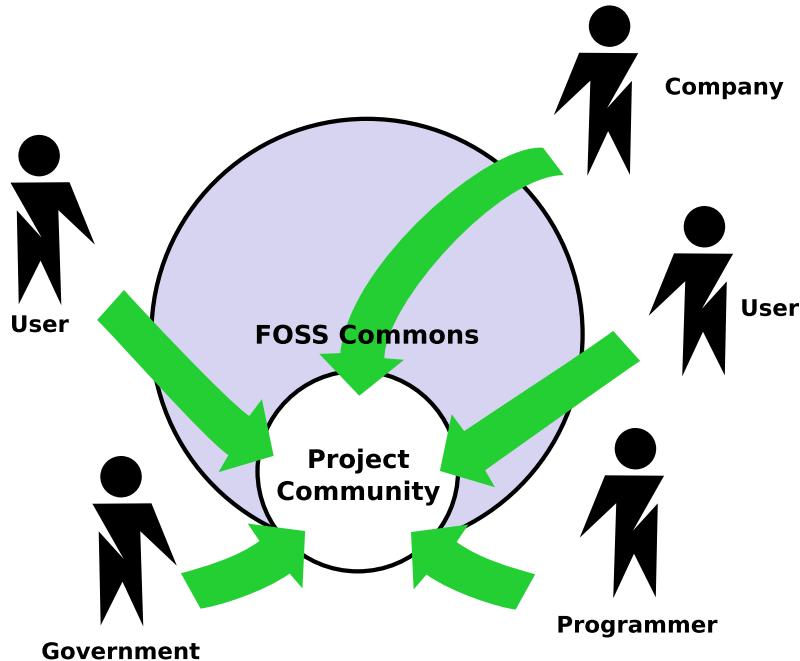

Choice of Support

Because users get to choose who supports and develops their software, they have the choice of any supplier.

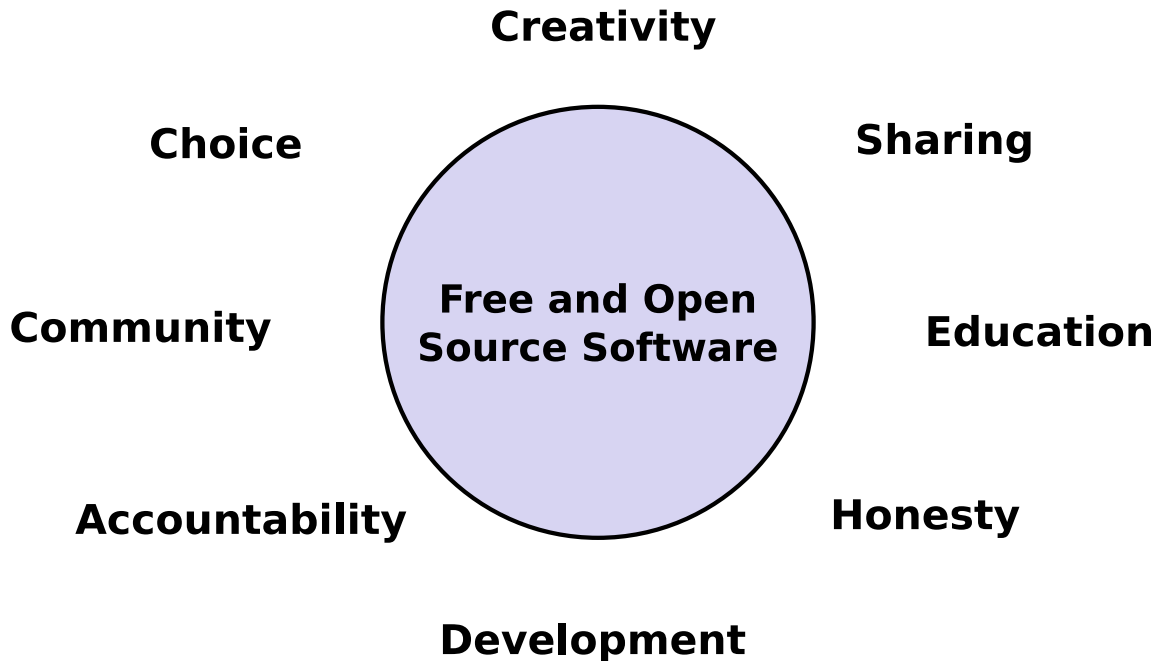

Community

**Programmers, organisations and users are all able to work with each other in a community to further the development.
With each contributing member, the pace of development increases.**

Last Words

FOSS development has many advantages, hopefully this guide has helped you understand how it works.

The End

Thank you for reading.
